SQL User Data Store Tables and Stored Procedures Configuration Guide

Updated October 27, 2021

Create SQL tables and stored procedures for SecureAuth IdP to use the SQL database for membership and / or profile information.

To see the guide that applies to all releases of the SecureAuth® Identity Platform, go to SQL user data store tables and stored procedures configuration.

Before you upgrade to the Identity Platform release 21.04 or later, you **must** update your SQL data store.

To learn about this important update, see Upgrade information for SQL data stores.
