

New Experience and Classic Experience Web Admin

Introduction

SecureAuth IdP version 9.3 introduces a new experience when configuring the Web Admin user interface. We call this the New Experience user interface, with the original user interface now called the Classic Experience user interface.

Going forward, content from the Classic Experience Web Admin console will be redesigned and reconfigured in the New Experience. In the 9.3 release, Active Directory and SQL Server data stores, and SAML applications – including Salesforce – can be configured in the New Experience.

This document helps you navigate the New Experience and Classic Experience user interfaces, provides names and images of like items found in each Web Admin console, and explains differences in how these items are configured.

Navigate the Web Admin

After logging on the Web Admin, you are in the New Experience Web Admin.

SECUREAUTH

Hello, and welcome to SecureAuth's new user experience.

What's new

Get started by connecting reusable data stores

Connect a User Data Store to use throughout the system. IF you need to make changes, you can do it in one place.

[Watch video](#) Watch how to connect a User Data Store or [visit the documentation site](#).

Next, use the Application Manager to connect applications

Leverage the reusable Data Stores to connect to dozens of pre-made application templates, or create a custom connections.

Switch back to the Classic Experience

[Go to Classic Experience](#) Log Out

You can always switch back to the Classic Experience by clicking the control on the top right corner. Just remember that User Data Stores and Applications in the new experience can't be edited in the Classic Experience

The left pane provides options to access [User Data Stores](#) or the [Application Manager](#).

To go to the Classic Experience Web Admin, click **Admin** on the upper right of the toolbar and select **Go to Classic Experience**.

Start by adding a data store...
